Equaly

Gender Your Texts Correctly

by Dennis Podkolsin, Felix Jacobsen and Marcus Koppelmann

Project Teaser

We believe in an inclusive future. A future where gendering is done just intuitively. This belief drove the design of Equaly.

Equaly is a web app that enables you to produce correctly gendered text in a heartbeat just from pasting in text that you want to be gendered, while experiencing the most intuitive UI we could think of.
Equaly's A.I. detects the language, the relationships and inner workings in your text and proposes a re-formulation so that no meaning gets lost and correct, inclusive gendering is achieved.
Equaly is simple and it is accessible. It works for you wherever you have a Browser at your hands. It is designed as an aid, but first and foremost as an educator for your own gendering journey.
The technical application itself is designed to be run quite literally by anybody and any institution or any individual. It just requires Java to be installed everything else is handled by Equaly.
Whether it be a university or a company ease of use and ease of maintainability combined guarantee for a low burden of entry and an easy insight into how gendering can be done quickly and applied on a large scale.

We're just at the beginning of a truly inclusive future in education and professional life and technology like Equaly can provide the seamless and automatic enabler for you and your contribution to this goal.
